11. (Amended) A process for production of a sintered oxide ceramic of composition  $Ce_xM_yD_zO_{z-a}$  with dense structure without open porosity or with a predetermined porosity comprising the steps of:

using a first doping element M selected from the group consisting of rare earths, but wherein  $M \neq Ce$ , alkali metals, earth alkali metals, and Ga;

using an educt with a second doping element D of at least one metal, but wherein  $D \neq M$ , selected from the group consisting of Cu, Co, Fe, Ni, and Mn wherein second doping element D is of submicron particle size or is a salt solution; and

sintering the educts at a temperature between 750- 1200°C until a density of at least 98% of the theoretically possible density is reached to form said oxide ceramic having a grain size no greater than 0.5  $\mu m$  and wherein the mol fractions used range from  $0.5 \leq x \leq 1$  for Ce,  $0 \leq y \leq 0.5$  for first doping element M, and  $0 < z \leq 0.05$  for second doping element D.

21. (Amended) The process according to claim 11 wherein sintering is prematurely interrupted leading to a porous structure with a specified lower density of 98%.

26. Process according to claim 11 characterized in that the educts are precipitated, filtered and calcinated jointly as inorganic salts.
